Week 2 – TD

Last week we implemented the logical structures of the program (key classes) as well as the foundations of the UI (we use qt Library), and defined the methods we are going to use to analyses the data.

This week, we have to finish the file management work which relates to how do we encode entries in files to save them. We also want to be sure that all interface between the UI team and the analysis team is done. **The goal would be to have a functioning journaling app by the end of next week.**

For this we need the UI to work (no need to implement all the functionalities and make it fancy for the moment) and that looks like the final product that we want. Later, we will reiterate on this work to add functionalities and make it look more beautiful. To facilitate this, please be sure to keep it in mind when you code: your implementations should be done so that it will be easier later on to come back to the code and add functionalities.

In terms of tasks to do, you all still have some from last time. Please check GitHub projects for what you have to do and let me know if you have any doubts, question or if you finished earlier. If you have questions about implementation please refer first to your subteam leader.

During the last 5 minutes of the TD or just after, please send me a quick report of what you did.

Enjoy!
